> widgets next to it (XYOUTS).

Thanks for your response but all my draw widgets are indicator lights (only 1 of 5 colors) for about 30 different things so putting the labels on manually would not be feasible. It would be better for me to spend my time writing something where all the indicators are written directly to a postscript file. I am using IDL on UNIX and have the plotting set to X windows. Thanks for the suggestion though.

Ryan.
