
Subject: Modified SLIDE_IMAGE?

I've been playing around with the IDL SLIDE_IMAGE procedure, and it doesn't quite do what I want. What I'd like is a SLIDE_IMAGE which has, instead of scrolling handles on the right hand image, a thing like BOX_CURSOR on the left hand image. This would allow the user to see where in the whole image (on the left) that he's seeing at full resolution (on the right). It would also make possible an interactive resize of the full res image via a resize of the BOX_CURSOR box in the left hand image. Has anybody seen such a thing?
