To the Newsgroup:

ITT Visual Information Solutions is actively continuing to enhance our IDL image processing support. So, we are collecting some information about what people need and want most from image processing tools in IDL.

Please e-mail your thoughts on the subject to:

kschultz at ittviz dot com

While this is not intended to be a tedious survey, here are some questions to stir your thoughts and help organize your response.

- Would you like to see improved support in a particular image processing discipline, such as astronomy or medical? If so, what specific algorithms would you like to see in IDL?
- Do you think that IDL should address some area or aspect of image processing that it does not address today? If so, what are they?
- What do you like or dislike about ilimage (iTools)?
- Describe what you do when you sit down to work on an image with IDL. A step-by-step description is the most useful. Tell us what you would like to have in the way of image tools to make your work easier.

And, of course, you can mention anything else you'd like to say on the subject.

While I can't promise we'll implement all your ideas, we do intend to take your input seriously. We do pay attention to the newsgroup. And we do have a few things in the next IDL release that are in place primarily due to the interests expressed here.

Thanks,
Karl Schultz
ITT VIS
