
Subject: Combining a surface and line plot object

I am using the idlgrsurface object to produce a filled contour plot (its faster than the idlgrcontour object and produces the same result) and am trying to plot a line over the contour using the idlgrplot object. This is just a vertical line which varies in location depending on where i click within the plot. However this technique does not work. I cannot get the vertical line to appear. If i set hide=1 in the contour plot the vertical line is there, but when the contour is plotted the line is not there. Of course the line is a different colour so thats not the reason why it doesn't show up. Any ideas?

many thanks,

Clive
