You might want to sign up as one of the beta testers for FastDL, which was mentioned in this newsgroup earlier today. I had a chance to fool around with that several months ago and I was extremely impressed. IDL tasks can easily be farmed out to specific processors on your machine, or to other processors in a network. You can have as many IDL "tasks" going on as many processors as you like. Very slick and very easy to do from the IDL command line.

Cheers,

David
