Subject: SetProperty of a COM object..

Hi all,

As we already know, COM object methods that have been defined using
the propget and propput attributes are accessible via the
IDLcomIDispatch object's GetProperty and SetProperty methods. What I
encountered is a COM object method that's defined as propget and
propputref. That means if I use the following codes,
object -> GetProperty, keyword= var1
I can retrieve the value of the keyword and store into var1, but the
type is Objref, an object. The problem is now if I try to set the value
of keyword to var2 with the same type (objref) as below:
object -> SetProperty, keyword= var2
I got the following error message:
SETPROPERTY: Object reference expression not allowed in this context:
var2
It's really strange to me and does anybody know what's the problem..

 Thanks very much for your kind assistance!

Best Regards,
