Sorry, I didn't mean "throw an error" as in error checking every parameter. I just meant that setting a positional parameter to UNDEFINED usually results in an error on the first line where the parameter is used an arithmetic.

I just did a search for N_PARAMS in <IDL_DIR>. There are 164 (15.9%) library routines which use N_PARAMS() and plenty of them are sitting in the iTools directory.

Mate, I'd get on board. The trains leaving soon :-)
