I've got some more really annoying questions if you want them...

> of images, lots of communication

Speaking of messaging. Which would you think is faster?

IDLitMessaging::DoOnNotify

or

IDLitData::NotifyDataChange

For heavily nested data, I would expect there to be an overhead of calling IDLitData::NotifyDataChange. The change would be propagated to every parent IDLitDataContainer and Observer.

IDLitMessaging is more particular and makes a single method call to IDLitTool, but iTools must search for the matching identifier to call ::OnNotify. There are a lot of string comparisons in IDLitMessaging which makes me feel very uncomfortable. I also don't know the etiquette of defining new IDLitMessaging "Message Strings". IDLitMessaging feels like spaghetti but I guess it gets the job done.
