Hello,

I'm getting strange contouring effects (tiling effects) when using the TV function to display 8-bit grayscale images on my 8-bit grayscale monitor (graphic card: DOME). The same images displayed using other software on the same monitor look fine, as well as the same images displayed using IDL on a different monitor. Sp, there's some problem with IDL and the graphic card together. "Device, decomposed=1 or 0" doesn't solve this problem. Help with this greatly appreciated...

Regards,
Mark
