OK, I have discovered, that FL does the same :-). So it comes from the underlying system C library.

On the other hand, FL can read back the following line, it can recognize, that the '-' sign is the beginning of the next number:

```
11.0335    11.0503    11.0615-1.60416e+006 1.05404e+007
```

I think IDL should do the same.

regards,
lajos
