Folks,

Does anyone know of a database where I can get fairly high-resolution land/water data for a particular lat/lon? In other words, I want to make a water mask for a particular image. If I know the lat/lon of each pixel, do you know of a way I can look in a database to see if that pixel is over land or water (or, presumably) both?

I can think of graphical ways to do this, but supposedly this is not of sufficient accuracy for the person asking the question.

Thanks,

David
