Subject: Redirecting stderr?

Hi,

# IDL\_STDIN\_UNIT - Unit 0 (zero) is the standard input for the IDL process.

# IDL\_STDOUT\_UNIT - Unit -1 is the standard output.

# IDL\_STDERR\_UNIT - Unit -2 is the standard error.

Is there a way to redirect STDERR to /dev/null from WITHIN IDL?

Reason: Still trying to figure out a way to suppress the syntax error messages when using RESOLVE\_ROUTINE... idl-bridge suppresses the error message BUT the routine that was resolved doesn't seem to be loaded in the original IDL session.

thanks and best regards,

dometz
