Hi all,

I have been looking around what's new in IDL 6.3 and what I found most interesting was the Java Connector. This utility allows you to integrate IDL Objects into Java Applications through a wrapper object.

This could be really useful because we all know IDL is powerful in processing but not very kind when designing large applications.

What I am planning is to use all the correction algorithms already implemented in IDL, encapsulate them in some IDL objects and use the Java Connector to call all this new objects from a large Java Application.

Then, the question:

- Have you tried this new Utility?

- Have you used Java Export Bridge or are you working with Java Connector. The problem of Java Connector is that the wrapper object
  is already predefined and with the Virtual Machine you cannot use some of the methods on the wrapper. In fact the methods that you cannot use are the most useful (setVariable, getVariable and ExecuteString).

Anyway, any comment will be appreciated.

Thanks in advance.
