Hi,

Is there a way to add signatures to user written function and procedures? So that validation of method calls are made at compile time vs. run time?

example:

```
pro foo, bar
```

```
  ...  
end
```

some calls in his code:

```
pro calling_foo  
  foo ;without the bar parameter  
end
```

So, is there a way when calling_foo is compile that it will catch this error at compile time as a syntax error?

gracias,

dometz
