
Subject: how would one do this in IDL?

I would like to polyfill a global map and then overlay a cloud layer on top it while not masking out either data layer,(i.e., filled landmass with cloudcover is still visible with some change in color - like looking at an object through fog). I've searched around the IDL docs but found nill.

How might I achieve this effect with IDL v4.0.1 ? Any suggestions would be greatly appreciated.
