Your string array should only be of dimensions (28). You'll read each of the 28 lines, and then strsplit them into the data array like so:

```
s_in=strarr(file_lines(filename))
openr, lun, /get_lun, filename
readf, lun, s_in
close, lun
free_lun, lun
length=n_elements(s_in)
temp=strsplit(s_in[0], '|', /extract, count=count)
data=intarr(length, count)
for i=0, length-1 do data[i, *]=fix(strsplit(s_in[i], '|', /extract))
```

This method also keeps the program more flexible. Hard coding values is rarely a good thing.
