We have got some oode with a nice standard Motif interface, we do not want to recode the interface so the following question came up.

a) Is it possible to redirect graphics output to a draw widget of a non-IDL application (instead into a draw widget of IDL)?

b) Is it possible to copy the content of the offscreen pixmap of IDL into a widget of a standard Motif application?

c) Does anyone know of an method to display and manage the content of a draw widget with respect to a decoration of a non-IDL application. In other words is it possible to place, resize, redraw etc. the plotting area of IDL that is framed by the decoration of non-IDL app/widget?

Any suggestions? -> mail them to pauli@ubaclu.unibas.ch
