Subject: write_png weirdness

Hello,

I noticed that in IDL 6.1.1 there is some weirdness related to the write_png
procedure. I have true colour image like
>print,size(hhh)
>   3   3   640   512   1   983040
which I want to save as a negative. However,

write_png,'file',255-hhh

results in a PNG file which is just black while

write_png,'file',byte(255-hhh)

does the right thing. This seems a bit strange since both, hhh and 255 are of
type byte, and so should be the difference (without forcing it).

regards,

 Bringfried Stecklum
