JD, a small nitpick: `ind_int_sort` will occasionally take the index from `[a, b]`, and not from just `a`. This can quickly lead to out of bounds conditions if the user doesn't want to index `[a, b]`, but just wants to index `a`. In my case, `a` is a column from a 2D string array, where `b` is just a 1D string array. I think a `where` statement is all that is needed to fix this (I know, it'll slow it down for large sets).
