I have this problem when I have to initialized a same-name array
multiple times. It goes like this:
FOR i = 1, N_ELEMENTS(list) - 1 DO BEGIN
  arr = BYTARR(list[i], list[i-1])
   Do Something here....
END

After a few, somewhere around 5, runs, the program crashes and reports
this error:
ERROR: Array has a corrupted descriptor.

I searched through the archives, and there is one thread about DICOM
image disposal addressed the similar question. I am wondering is there
anybody who knows how to get around this?

P.S. I am running 6.1 on Windows XP Pro.
