Just a guess, but look in your PV-Wave install directory and see if there are 2 executables. Many vendors ship both a 32 and 64-bit version of their program with their 64-bit version. It might be as simple as changing your symlink to point to pywave64 or something like that.

It's been a while since I installed PV-Wave. The newest version I have around here is 2.01:) I don't know what's fashionable these days. /var? /usr/local? Poke around and you should be able to find the install dir.

Worst case, PV-Wave ships separate 32 or 64-bit versions and you'll have to install the 64-bit version.

Try print, !Version or PV-Wave's equivalent.
