## Subject: LONG - reads 4 or 8 bytes??

Posted by subir.vasanth on Tue, 12 Dec 2006 21:10:46 GMT

Hi All,

I would appreciate if someone could help me with a problem that we are having. I am trying to use the LONG function to convert bytes in to a longword.

On the first workstation (Solaris 10, PV-Wave v 8.51) LONG reads 8 bytes from the input byte array. However, on the second workstation (Solaris 10, PV-Wave v8.50), LONG reads only the first 4 bytes! Is there a configuration setting that needs to be set for LONG to read 8 bytes instead of 4. Has anybody out there had a similar problem?

Please let me know if you need more information of the environment in which we are running.

Thanks!
