Sick, sick, sick...

This damn AVHRR image registration problem has been driving me bonkers. I spent about 10 hours on it yesterday, right up until my wife forced me to drink some eggnog for Christmas Eve, and I woke up thinking about it this morning before opening some presents with the family. (My wife thought I was concentrating on the new Christmas CD she gave me.)

But about five minutes ago I finally figured it out.  
Perfect!

I'll have an article that describes how it is done out soon, but I just wanted to let everyone know so you could enjoy your Christmas holidays. ;-)

Merry Christmas!

David

P.S. Just so you know, the documentation was wrong (I guess we all assumed that), but everything you need to know is built into the GeoTiff file, if you can just figure out how to decipher it. Those MAP\_PROJ\* routines are VERY interesting, if exceedingly poorly documented. :-)
