Subject: Find number of processors on a machine?

Can anyone tell me how to find out the number of processors on a machine from within IDL (OSX/Unix)? I am happy to spawn a system call, but I don't know how to find out characteristics of the machine from the shell, either. I'm trying to implement and IDL\_IDLBridge program that sets up bridges to nproc-1 child IDL processes when there are nproc processors.

Thanks, Dick French
