The values are not the pixel edges, this is one of the first things I checked. But, I am wondering if it is actually possible to *calculate* the pixel positions from the GEOTIFF information embedded in the file. Does anyone know how to do that?

Perhaps the information is embedded in the file and I just don't know how to access it. (Maybe this is what you mean by "AVHRR nadir resolution of 1.2 km".)

Cheers,

David
