Hi all,

I am a newbie in IDL. Although I cannot handle the following problem, I am sure for the 'Masters' this is peanuts.

The problem:

I wish to filter an array of redundant data in one line. This is a part of the line to be filtered:

```
-Inf      -NaN      -Inf    0.542373    2.39394    2.28125  
 0.000000    0.000000    0.000000  
   3.21053    1.21839    0.000000     -NaN    0.967213  
 2.03448    0.724138    0.000000    0.000000    0.000000  
-NaN
```

With WHERE I can get rid of the zeros, but I dont know how to exclude the '-NaN' and '-Inf'.

Any help would be most welcome,
greetz, Jochem
