Hi all,

I am a newbie in IDL. Although I cannot handle the following problem, I am sure for the 'Masters' this is peanuts.

The problem:

I wish to filter an array of redundant data in one line. This is a part of the line to be filtered:

```
-Inf      -NaN      -Inf      0.542373      2.39394      2.28125
0.000000  0.000000  0.000000
      3.21053      1.21839      0.000000      -NaN      0.967213
2.03448    0.724138    0.000000    0.000000    0.000000
-NaN
```

With WHERE I can get rid of the zeros, but I dont know how to exclude the '-NaN' and '-Inf'.

Any help would be most welcome,
greetz, Jochem
