Dear All,

Since a few months I have been working on a free online hyperspectral reference library (database.hyperspectral.info). As an output I would like to offer the envi spectral library format.

However, I cannot figure out what the definitions of these files is. Does somebody have a good explanation of the layout of these files?

Which fields in the header, what delimiters and how is the data organized at byte level in the datafile?

I know that some people of ITTVis frequent this forum: Could you perhaps give me a hand?

Thanks!

Jelle.
