Dear All,

-- not a pure IDL question, sorry --

Over the past months I have been working on a spectral reference library online (database.hyperspectral.info). However, I have been unable to figure out the ENVI spectral library format, which I would like to generate on-the-fly from the database, using php.

Does somebody have a good description of the formatting (Fields, byte-types, delimiters) for ENVI spectral library files? (I know some people from ITTVis frequent this site.. Can you give me a hand?)

Cheers,

Jelle
