
Subject: Some problems about 'Plot' in IDL

Hi, I have some problems in plotting data using IDL. I would appreciate any help.

1. I want to have two vertical axis on one plot, with different scales. (e.g. one using 'cm', the other using 'inch') One axis at the left, the other one at the right. Can IDL 'Plot' do it? Otherwise I'll have to write it by myself.

2. I want to plot a few sets of data on one plot, using the same x-axis. But for the y axis, it should have several origins, each corresponds to one set of data. It's easy to just give those sets of data different y-offset to place them at different height. The question is how to mark the y-axis?
