I think that the problem with applying unit testing to IDL is that a lot of us tend to fart about (<http://cow.mooh.org/idl.shtml>) . There is often no planning process, so there is no foresight about designing a test bed before writing the application.

As a rule of thumb, most arguments to a procedure are converted to float() on the first line of arithmetic.

I would argue that a good unit test does not have to iterate over all combinations of heap variable types.

Perhaps you could create a wrapper which cycles through all heap variable combinations.

Robbie
