Hello,
I have col and row coordinates of a polygon that I would like to plot
on an image using PLOTS function, but the data is noncontiguous, how
can I re-arrange the data so that it is contiguous, i.e. starting from
an arbitrary point on the polygon, the next point is the one coonected
to the first point say by moving anticlockwise and so on. Otherwise is
there another function in IDL that can plot noncontiguous data over an
image?
Thanks.

ashraf.
