
Subject: open sockets

Dear folks,

I am using the ASTROLIB webget procedure for retrieving data for a sample of targets in a loop. The procedure calls socket like this

```
socket, unit, Server, Port, /get_lun,/swap_if_little_endian
```

and uses "free_lun,unit" to deallocate the unit. However, after 28 calls of webget the following error message pops up

SOCKET: All available logical units are currently in use.

which means that all units available from the get_lun pool are still open. In order to be sure that they will be actually closed I added "close,unit" after "free_lun,unit". But this does not change anything (as you might have guessed). I thought I'd better ask before trying the "/force" keyword as a last resort.

regards,

Bringfried Stecklum
