
Subject: How can I add parameter to curvefit?

Hi,

I'm doing a curve fitting using CURVEFIT. However, I would like to be able to pass on an extra parameter to the function that CURVEFIT calls. (i.e. the one that returns the function I'm trying to fit to and its derivative.) In other words, if the function has three parameters, do a least-square fit using just two of the parameters. The only ways I could think of were (a) hack CURVEFIT.PRO to add a parameter to the function calls, or (b) save the parameter in a file and read that. (a) has a problem with portability, and (b) seems rather slow considering the function is called many times. Is there a better way to do this?
