The Laboratory for Atmospheric and Space Physics at the University of Colorado is seeking an experienced software developer to participate in the development of state-of-the-art space mission ground system software for present and upcoming NASA space science projects. LASP is one of the top space science research institutes in the country with facilities in Boulder, CO employing approximately 300 scientists, engineers, support personnel, and students. This individual will work closely with scientists, engineers and space system operators in the development, operation, and maintenance of space system mission operations ground software systems, primarily using IDL, Java, C, and others. This person may also supervise one or more student assistants.
P.S: IDL was originally created at LASP!
