Hi Folks,

If you're setting up a spectral math expression, there's a step where you match the variable representing a spectrum (s1, s2, etc.) to a list of "available spectra" that you're going to perform your spectral math on. Is there a way to access that list programmatically? I want to do some things with single spectra, not an entire file, that are a bit too complicated for a custom spectral math routine - I need to read data files, access other procedures and dialog boxes, etc.

Jeff
