---

I have 3 seperate fits files in red, green and blue and I think I need to combine them before I can do anything with them. When I look at them individually, they seem blank. I tried using the rgb to tiff procedure in idl but its still mostly blank with a small bit of it white. I got the data from the Faulkes telescope and the star I want shows up in the jpeg image. I'm trying to get light curves of variable stars from fits files. I don't know what I can do with a tiff file even if it did show up properly. I'm still not very good at this stuff so any help would be appreciated.

Thanks.
