I posted a message earlier last week asking for help printing to a color HP Deskjet. I found out what the problem was, so I thought I'd share it with you (perhaps someone might find it useful).

This is pretty strange (at least to me). HP Deskjets have trouble printing sometimes (very slow!!) if the machine doesn't have enough memory. I had 16 Meg on that machine, so I didn't think it'd be a problem. Wrong! I tried it on a 32 Meg Pentium, and it works just fine now. It seems a shame that it takes such a powerful machine to print a graph. Anyway, thought it might mean something to somebody.
