I have a geotiff image and I do a subset using the keyword sub_rect
like this!

```
image = read_tiff('C:\IDL\lImage_GEOTIFF\vul_flora_.tif', geotiff =  
geotiff, $  
           sub_rect = [ xsize, ysize, width,  
height])
```

The image is georeferenced. The user inputs the sub_rect in lat/long
(xsize, ysize, width, height), and I need to convert this input to the
cartesian coordinates of my image (pixels). The keyword SUB_RECT works
only with pixels?

thank you

Aleksander
