Dear all,

I have a question that need your kind help:

I have an array X with 101 columns and want to output the first column to integer format and the rest 100 columns to float format:

```
OPENW,1,'test.txt'  
printf, 1, X, format='(I0,100(2X,;,F0))'  
close, 1
```

However, because I used the group specification, format control reverts to the group repeat specification whose opening parenthesis matches the next-to-last closing parenthesis of the format string. So, the data are output to float format except the first line. Would you please give me some advices for fixing this problem? Thanks

Maybe I cannot use group specification here.
