Sorry Guys, I should have made myself clearer.

I'm afraid David this is not actually the question you describe in your article.

and I do not expect better accuracy than I provide.

There is nothing wrong here with the floating point accuracy.

```
print,4.700*100.00
```

```
470.000
```

It is the conversion to integer (I imagine) which makes no sense.

```
print,fix(4.700*100.00)
```

```
469
```

also (which is what I really needed)

```
print,string(4.700*100.00,format='(i3)')
```

```
469
```

Cheers

Boryana
