Hi all

I want idl to output data into txt file, the data have seven columns, but idl will export first five column into one line and another two into seperate line.

```
openw,1,'source_countrate'  
for i=0,n do printf, 1, data[0,i], data[1,i],  
data[2,i],data[3,i],data[4,i],data[5,i],data[6,i]  
close,1
```

I want it to be a 7xn table, so for same i, data[0,i], data[1,i], data[2,i],data[3,i],data[4,i],data[5,i],data[6,i] are in one line.
Thanks in advance and I appreciate your help.
