Hi!

I have a multispectral image and I need to extract the z profile from some pixels. It can be easily done using Envi Z-Profile tool...

But I have a lot of pixels to make that. And it's very time-consuming activity. So, I'm trying to make an IDL routine to extract the z-profiles from the pixels and export it to an ASCII.

But, before beginning... Does anybody know if such code already exists? Any tip to make that?

Cheers,
Julio
