Before you go to the trouble of learning four or five
new programming languages to solve this problem, I would
try something simpler. Get a sheet of paper, and with a
pencil write down the six or seven steps that you would have
to take to solve this problem. Label the list "Algorithm".

Then, study the list and see if you can implement each
step in whatever programming language you have at hand.
Who knows. It could led to a solution. At the very least,
it might engender some useful questions. :-)

Cheers,

David
