
Subject: Anyone using IUE software library in IDL?

I have a colleague who is trying to use the IDL library of routines to analyze IUE (UV stellar spectra) data. I downloaded the latest IUE library for her, and now it seems that every routine requires that the structure variable !iuer be defined somewhere. However, I can't find any documentation that explains how this variable gets set or what values it should have. I've done 'grep -I !iuer *.pro' and I get thousands of hits, but none of the routines has a helpful name such as 'iue_startup.pro' or 'iue_init.pro' - they just contain helpful messages that tell you that you'd better have all of these variables set to something.

Help, anyone? My friend will be grateful!
