Kevin,

Tho I don't have/never used ENVI before, this is not an ENVI problem.  
I can guess from past experience that these scripts are probably not  
there. So I suggest that you copy the necessary tar files onto /usr/  
local/envi or whatever directory you choose and untar them  
individually and if needed create the links yourself inside  
your .bashrc (or for the shell you are using). I made my copy of IDL  
work like that (scripts - post\_unpack etc. - were missing). I ain't  
complaining, but ITTVIZ' GNU/Linux support could be a lot better. But  
of course, there is this forum :-)

Hth,

/rk
