
Subject: Generate C++ code from existing IDL

Hi,

I was given an IDL file and was asked to implement it.

How can I create a Project with VS2005, load the IDL somehow and let VS2005 generate the classes with empty methods.

After that I just have to implement each method.

That should actually be possible, because all the information about the classes already exists in the IDL-file, right?

Can somebody help me or give me a hint?

Thanks,
Vedran
