
Subject: scaling idlGrAxis ticks?

Temperature is raising which makes my head do weird things, forget stuff etc :)

I'm having a normal idlGrPlot object which looks good. But when I put different data in it, my axis gets reformed in a bad way :(

Have had this before and then the answer was to play with `recompute_dimensions`. Well, that works fine for the labels, but an `idlGrAxis` object doesn't have a `recompute_dimensions` function :(

Did I miss something here or is it not the sun?

Cheers, Laurens
