Hi,All!

Is there anyone have been tested that the max export columns of one row by the PrintF method?

My friend use this method to export a big file with a fixed format,this format prescribe one row of data should be wrote in one row.But once the data of that line has more than 80 columns,it'll be detached to 2 lines.Why?The Help Doc of the IDL didn't tell us there is any limitation of the "PrintF".How could I solve this problem?

Thanks!
