I'm running Fedora 7 now. The distribution doesn't include an old libX11. Many FC6 binaries work on F7 since the toolchain is basically unchanged, so I forced the install of the FC6 libX11. This worked until the first upgrade, at which point the package manager just deleted everything that depends on X11.

I installed the IDL 6.4 demo but it causes a hard crash when I try to use graphics. I'm rebuilding gdl now.
